AUTHOR'S NOTE

We are changing the face of our world at an alarming and an increasing pace.

We have lost 20% of the earth's wilderness in the last two decades, due to human pressure. If this rate of loss continues, we will lose all wilderness within the next 50 years.

By the year 2100, half of the world's terrestrial plant and animal species may be extinct.

Already at least two species become extinct each hour.

Our planet is changing before our eyes. But it doesn't have to be this way: solutions do exist. By understanding and changing the way we personally affect the environment, we can make a difference.
